CO324 Lab 06: Stream Sockets

Objectives

You should learn,

- The differences between datagram and stream sockets.
- Use of thread pools to build concurrent servers.

- http://docs.oracle.com/javase/tutorial/essential/concurrency/pools.html

Exercises

- 1. Write a **serial** (non-threaded) web server. It should be capable of serving GET requests for text/html and image/jpeg resources. The server should set the Content-type and Content-length headers based on the file type and size. Hint: you may find java.nio.file.File (specifically the *probeContentType*() method) useful.
- 2. Use thread pools to make the web server handle requests concurrently.
